

What is photovoltaic conversion efficiency?

The photovoltaic conversion efficiency, which can be determined from the current versus voltage(I-V) characteristic curves of an illuminated photovoltaic cell (or panel) is an important factor in identifying its quality, performance and efficiency under varying environmental conditions.

Do photovoltaic solar panels degrade over time?

Age of the Panel - Over time, photovoltaic solar panels degrade, reducing their efficiency. PV panels are expected to operate for 20 to 30 years, but over time the conversion efficiency can degrade by as much as 0.5% to 1% per year due to the daily exposure to the elements and normal wear and tear as it heats up and cools down daily.

Are solar thermal panels better than solar photovoltaics?

Generally, solar thermal panels are more space efficient than solar photovoltaics in collecting heat from the sun's rays. Also, the technology required to capture and heat water is much less complex than for photovoltaics. This makes solar thermal panels an ideal solution for heating up water.

Are monocrystalline solar panels more efficient than polycrystalline panels?

Monocrystalline solar panels are generally more efficientthan polycrystalline panels. Monocrystalline panels have higher purity silicon, which allows for better electron movement, resulting in higher efficiency. Polycrystalline panels are less expensive but slightly less efficient due to lower silicon purity.
