#### Do inverters convert 12V DC to AC?

Inverters convert 12V DC to ACand allow you to run AC appliances from your 12V DC system. In Australia the AC voltage is 240V 50Hz. Electronics and step up transformers are used to change from direct current to alternating current and to increase the voltage. Your inverter needs to be sized to be able to supply steady state and peak loads.

#### How much power does a 12V inverter use?

A typical 12V system might be good for say 100A on the 12V side. This means a maximum AC power of just  $100 \times 12 / 1.1 = 1090W$  (divide by 1.1 to account for inverter efficiency). So regardless of the size of your inverter, a typical 12V system might max out at around 1100W. Slightly higher peak power could be attainable.

#### Can a 12V Inverter Supply a high power load?

The current on a 12V system is a limitation for using inverters to supply high power loads. Volt drop and cable sizing becomes an issue. It becomes difficult to manage volt drop and cable sizes become impractical as power becomes large. A typical 12V system might be good for say 100A on the 12V side.

#### How to connect multiple inverters to a single battery bank?

When connecting multiple inverters to a single battery bank, you can either use synchronized inverters for the same load or separate inverters for different loads. It's important to ensure the battery bank has enough capacity and the right C-rate to handle the total power demand of the inverters.

#### Do I need a 240V inverter?

If permanent 240V distribution is requiredthis must be installed and checked by a certified electrician and must conform with relevant standards. Inverters convert 12V DC to AC and allow you to run AC appliances from your 12V DC system. In Australia the AC voltage is 240V 50Hz.

#### How many volts can a 12V inverter handle?

For example many inverters can tolerate down to around 10.5V. The smaller the volt drop, the more efficient your system is. A typical figure in electrical design is 5%, which in a 12V system is 0.6V. So the arrangement above passes the test. A more stringent criteria for a 12V system would be say 0.2V.
