

What is a liquid cooling thermal management system?

The liquid cooling thermal management system for the energy storage cabin includes liquid cooling units, liquid cooling pipes, and coolant. The unit achieves cooling or heating of the coolant through thermal exchange. The coolant transports heat via thermal exchange with the cooling plates and the liquid cooling units.

What is a liquid cooling unit?

The product installs a liquid-cooling unit for thermal management of energy storage battery system. It effectively dissipates excess heat in high-temperature environments while in low temperatures, it preheats the equipment. Such measures ensure that the equipment within the cabin maintains its lifespan.

What is a liquid cooling system?

This project's liquid cooling system consists of primary, secondary, and tertiary pipelines, constructed by using factory prefabrication and on-site assembly within the cabin. The primary liquid cooling pipes utilize 304 stainless steel, whereas the secondary and tertiary pipes are made from PA12 nylon tubing.

What is a liquid-cooling high voltage box?

The liquid-cooling high voltage box is chiefly installed in the energy storage liquid-cooling battery cluster and manages the power on/off for the battery cluster system. It also connects to battery cluster high voltage and signal output interfaces. The liquid-cooling high voltage box must meet the following requirements:

How much power does an energy storage container need?

Normal lighting requires a 380/220V power input. Evacuation signs with batteries are provided at exits. 3.8.4.2 Energy storage containers should use rock wool materials for thermal insulation design, featuring insulated wall panels, doors, floor, and roof to prevent the formation of thermal bridges that cause excessive heat loss.
