

Does more battery capacity mean more power?

Like any other battery, the more energy it can store, the more stuff you can usually power with. Of course, there are other factors (like power rating and chemistry), but as a general rule of thumb, more capacity means more devices powered for longer periods.

What is battery capacity?

When manufacturers or installers talk about battery capacity (or energy capacity), they usually talk about one of two metrics a battery is rated on: total capacity and usable capacity. We'll get into why those are different further down. For the time being, it's all just " capacity. "

What is energy capacity?

Here's a complete definition of energy capacity from our glossary of key energy storage terms to know: The energy capacity of a storage system is rated in kilowatt-hours (kWh) and represents the amount of time you can power your appliances. Energy is power consumption multiplied by time: kilowatts multiplied by hours to give you kilowatt-hours.

How much power does a battery system need?

For example, if your critical loads require 2,000 watts of power and you need backup power for 24 hours, your total load would be 48,000 watt-hours (2,000 watts x 24 hours). Once you have determined your total load, you can select a battery system that can meet your power needs.

How are batteries rated?

Batteries are rated for two different capacity metrics: total and usable. Because usable capacity is most relevant to the amount of energy you'll get from a battery,we like to use usable capacity as the main "capacity" metric to compare storage products. Also,from our energy storage glossary,see how the two terms differ below:

Which solar battery has the most capacity?

Eguana, Electriq Power, and sonnen currently make the home batteries with the most capacity. Battery capacity can be a misleading metric: in many cases, you can stack multiple batteries together to make a larger system. Compare solar-plus-storage quotes from local installers on EnergySage.
