How can big data industrial parks improve energy storage business model?

Combined with the energy storage application scenarios of big data industrial parks, the collaborative modes among different entities are sorted out based on the zero-carbon target path, and the maximum economic value of the energy storage business model is brought into play through certain collaborative measures.

Are big data industrial parks a zero carbon green energy transformation?

From the standpoint of load-storage collaboration of the source grid, this paper aims at zero carbon green energy transformation of big data industrial parks and proposes three types of energy storage application scenarios, which are grid-centric, user-centric, and market-centric.

What are the economic indicators of big data industrial park?

Based on the characteristics of the source and load of big data industrial park, this paper selects typical income and cost indicators, including financial net present value, internal rate of return, and dynamic payback period of investment, to measure the economy of three scenarios of big data industrial park.

How much energy does a big data center consume?

In all sectors of energy consumption, big data centers account for a large proportion of electricity consumption. Official data showed that China's big data centers consumed approximately 160.889 billion kWh in 2018, accounting for 2.35 percent of the total power consumption.

Does energy storage configuration maximize total profits?

On this basis, an optimal energy storage configuration model that maximizes total profits was established, and financial evaluation methods were used to analyze the corresponding business models.

How do you find the Sunrise force curve of a big data industrial park?

The typical sunrise force curves of the power side and load side of the big data industrial park can be obtained by aggregation, which are shown in Fig. 7, where green is the sunrise force curve of the power side and black is the daily demand curve of the load side. Fig. 7. Power curves of source and load on typical days.
