

Can base station energy storage participate in emergency power supply?

Based on the established energy storage capacity model, this paper establishes a strategy for using base station energy storage to participate in emergency power supply in distribution network fault areas.

What is the energy storage output of a base station?

The energy storage output of base station in different types. It can be seen from Fig. 20 that the energy storage of the base station is charged at 2-3h, 20h and 24h, when the load of the system is at a low level, and the wind power generation is at a high level.

How can a base station save energy?

Energy saving is achieved by adjusting the communication volumeof the base station and responding to the needs of the power grid to increase or decrease the charge and discharge of the base station's energy storage. However, the paper's pricing of energy interaction ignores the operating loss costs of the operator's energy storage equipment.

Do mobile operators support the use of base station energy storage?

The premise of the research conducted in this article is that mobile operators support the use of base station energy storageto participate in emergency power supply.

What is a base station energy storage capacity model?

Based on the base station energy storage capacity model established in contribution (1), an objective function is established to minimize the system operating cost in the fault area, and the base station energy storage owned by mobile operators is used as an emergency power source to participate in power supply restoration.

Why do base stations have a small backup energy storage time?

Base stations' backup energy storage time is often related to the reliability of power supply between power grids. For areas with high power supply reliability, the backup energy storage time of base stations can be set smaller.
