

What is a magnade programmable DC power supply?

All MagnaDC programmable DC power supplies utilize high-frequency IGBT- and MOSFET-based power processing in a current-fed topology. This topology adds an additional stage over the conventional voltage-fed topology for enhanced control and system protection, ensuring that even under a fault condition, the power supply will self-protect.

What is a master-slave programmable DC power supply?

User I/O Pinout Definitions All MagnaDC programmable DC power supplies come with master-slave capability. The MagnaDC master-slave strategy ensures no degradation in performance as units are added in parallel or series by providing gate drive signals directly from the master to the slave units.

How many volts does a digital DC power supply have?

This digital DC power supply has maximum output voltage of up to 30 voltsand current up to 1.6A amps or 12V at 4A. It is a highly integrated power supply that you can set up constant current or constant voltage, Plus it comes with 2 USB port for technician to use for cellphone repair and more. The USB port is a dual port with 5V at 2A.

Where are magnade programmable DC power supplies made?

MagnaDC programmable DC power supplies are designed and manufactured at Magna-Power's 73,500 sq-ft vertically integrated USA manufacturing facility in Flemington, New Jersey. From raw materials to the completed product, Magna-Power has insourced nearly the entire production process to maintain complete control of quality, cost, and build-time.

What interfaces are available for magnade power supplies?

MagnaDC power supplies include RS232communication interface standard with optional LXI TCP/IP Ethernet (+LXI) and IEEE-488 GPIB (+GPIB) options. SCPI Command Listing Using the rear User 37-pin I/O connector,the MagnaDC power supplies can be completely controlled and monitored using external signals.

How does a magnadc power supply work?

Using the rear User 37-pin I/O connector, the MagnaDC power supplies can be completely controlled and monitored using external signals. The voltage, current, over voltage and over current set points are set by applying a 0-10V analog signal. Each diagnostic condition is given a designated pin, which reads +5V when high.
