How does a motor work?

In a typical motor, a component called a rotor turns inside a stationary component called a stator. One of those components contains permanent magnets that have south and north poles. The other has wire coiled around it. Putting electricity through the coils creates magnetic fields that attract and repel the poles of the permanent magnets.

How does a motor turn electricity into movement?

Designing a motor to turn electricity into movement is tricky. In a typical motor, a component called a rotor turns inside a stationary component called a stator. One of those components contains permanent magnets that have south and north poles. The other has wire coiled around it.
