

What is a battery energy storage system (BESS)?

The other primary element of a BESS is an energy management system (EMS) to coordinate the control and operation of all components in the system. For a battery energy storage system to be intelligently designed, both power in megawatt (MW) or kilowatt (kW) and energy in megawatt-hour (MWh) or kilowatt-hour (kWh) ratings need to be specified.

What are the components of a BES unit?

BES units typically contain a battery pack, an inverter, and a control system. The battery pack comprises individual battery cells (of various chemistry make ups) that are connected in a series to increase the overall voltage and capacity of the unit.

Do Bess products need an external power supply?

Most BESS productson the market require an external power supply circuit for their auxiliary loads, although some have built-in circuits and do not need an external supply.

Do I need backup power for a Bess auxiliary load?

For certain projects,backup power must be provided for the BESS auxiliary load as required by the BESS supplier or fire codes. Some BESS suppliers mandate uninterrupted power to maintain the operation of thermal management systems, ensuring battery temperatures remain within desired limits to minimize degradation.

What are the features of a Bess battery?

In addition to the above battery characteristics, BESS have other features that describe its performance. The ramp rate at which the BESS may decrease or increase its power output - ramp down or up, respectively. The response time is when BESS must move from the idle state and start working at full power.

How does a Bess work?

A BESS collects energy from renewable energy sources, such as wind and or solar panels or from the electricity network and stores the energy using battery storage technology. The batteries discharge to release energy when necessary, such as during peak demands, power outages, or grid balancing.
